## "UKRAIN 5 mg Ampullen": Salmonella Typhimurium Reverse Mutation Test

### SUMMARY

#### Method

"UKRAIN 5 mg Ampullen" was tested for mutagenic activity with the "*Salmonella typhimurium Reverse Mutation Test*" (Ames Test). The study was conducted in accordance with the OECD-guideline 471 and EEC Guideline 92/69, part B.14.

The test substance, diluted in water, was tested at concentrations ranging from 1.2 µl to 100 µl per plate according to the "*direct plate incorporation method*" without external metabolism as well as with an external metabolising system (S9-mix). As test system the bacterial strains *Salmonella typhimurium* TA97a, TA98, TA100, TA102 and TA1535 were used. Negative and positive controls were included. An independent repetition of the experiment was performed.

#### Results

##### Positive controls:

All positive control groups showed significantly increased mutation frequencies which demonstrate the sensitivity of the test system.

##### Test substance:

##### Solubility:

The test substance was freely miscible with water.

**Toxicity:**

The test substance was not toxic to the Salmonella strains used. No reduced or missing bacterial background lawn was observed.

**Mutagenicity:**

In none of the concentrations tested and with none of the strains used a statistically significant increase of the mutation frequency to more than twice the amount of the control samples was obtained. Metabolic activation did not change these results.

**Conclusion**

According to the results obtained in this study, **"UKRAIN 5 mg Ampullen"** is **non-mutagenic in the Ames test** with the strains TA97a, TA98, TA100, TA102 and TA1535 up to 100 µl per plate.

## GOOD LABORATORY PRACTICE COMPLIANCE STATEMENT

Statement concerning the study:

### **"UKRAIN 5 mg Ampullen": Salmonella Typhimurium Reverse Mutation Test**

This study meets the requirements of the OECD Principles of Good Laboratory Practice, OECD Environment Health and Safety Publications, Series on Principles of Good Laboratory Practice and Compliance Monitoring No. 1, Paris 1998, with the exception that the solutions of the test substance were not analysed for stability and concentration of the test substance.

Seibersdorf, 15 January 1999

Mag. Peter Weniger  
Study Director

## QUALITY ASSURANCE UNIT

Statement concerning the study:

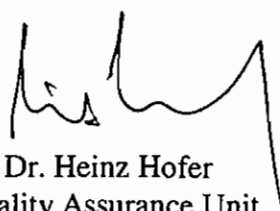

**"UKRAIN 5 mg Ampullen":  
Salmonella Typhimurium Reverse Mutation Test**

The following inspections were made concerning this study:

| date of inspection | inspected phases   | date of report to the management |
|--------------------|--------------------|----------------------------------|
| 28 September 1998  | protocol           | 28 September 1998                |
| 24 November 1998   | experimental phase | 24 November 1998                 |
| 14 January 1999    | report             | 14 January 1999                  |

This report has been reviewed by the Quality Assurance Unit. The reported methods and procedures were found to describe those used and the results to constitute an accurate representation of the data recorded.

## "UKRAIN 5 mg Ampullen": Salmonella Typhimurium Reverse Mutation Test

### 1. INTRODUCTION

This study was performed to determine a possible mutagenic action of "UKRAIN 5 mg Ampullen" with the Salmonella typhimurium reverse mutation test (Ames test). This test is sensitive to frameshift mutations as well as to base pair mutations. The performance of the test with and without an external metabolising system ensures the detection of the mutagenic action of the test substance itself as well as of its metabolites.

### 2. MATERIALS AND EXPERIMENTAL CONDITIONS

The compositions of the different solutions are shown in Appendix 1.

#### 2.1. Test substance

##### 2.1.1. Description by the sponsor

| Batch No.:                              | 544324   |
| Purity:                                 | 95.9 %   |
| Certificate of analysis:                | See Appendix 2   |
| Concentration of the active ingredient: | 1 mg/ml  |
| Solubility in water:                    | miscible   |
| Density:                                | 0.9986   |
| pH:                                     | 3.49   |
| Storage:                                | ambient temperature, protected from light                    |
| Stability at storage conditions:        | 5 years  |
| Expiry date:                            | June 2001  |

### 2.1.2. Description and characterisation by the test facility

|                                  |   |
|----------------------------------|---|
| Date of receipt:                 | 28 September 1998   |
| Label on the shipping container: | UKRAIN®<br>Wirkstoff: Chelidonium majus L. Alkaloid -<br>Thiophosphorsäurederivat<br>1 Ampulle a 5 ml<br>1 ampoule a 5 ml<br>i.v. oder i.m. Injektion<br>i.v. or i.m. injection<br>5 mg/5 ml<br>Hersteller: Nowicky Pharma<br>Margaretenstrasse 7 A-1040 Vienna |
| Appearance:                      | light brown solution  |
| Storage:                         | room temperature, protected from light  |

### 2.2. Reference substances

- 2-Aminoanthracene, (Sigma, article A-1381. Practical grade).
- 7,12-Dimethylbenz[a]anthracene (Sigma, article D 3254)
- 1,8-Dihydroxy-anthraquinone (Danthron, Sigma, article D-5636, 95%).
- 2-Nitrofluorene (Aldrich, article N 1,675-4)
- Sodium azide (Sigma, article S-2002)
- 4-Nitro-o-phenylenediamine (Sigma, article N-9504).
- t-Butyl-hydroperoxide (Schuchard, article 814006, 70 % aqu. solution).

1,8-Dihydroxy-anthraquinone, 7,12-dimethylbenz[a]anthracene and 2-aminoanthracene are mutagenic only when activated by a metabolising system; 4-nitro-o-phenylenediamine, 2-nitrofluorene, t-butyl-hydroperoxide and sodium azide are directly acting mutagens.

Sodium azide and t-butyl-hydroperoxide were dissolved in sterile water. The other reference substances were prepared from stock solutions in dimethylsulfoxide.

### 2.3. Test and reference substance solutions - preparation

The test substance was used undiluted for the highest concentration group. The solutions for the lower concentrations were prepared by subsequent dilution of one volume of the higher concentrated solution with two volumes of water.

The test substance ampoules were opened and the test substance was diluted immediately before use. The time between preparing the test substance solutions and the last application to the bacteria was less than 3 hours.

4-Nitro-o-phenylenediamine, 1,8-dihydroxy-anthraquinone and 2- aminoanthracene were prepared from stock solutions in DMSO (dimethylsulfoxide).

Sodium azide and t-butyl-hydroperoxide were dissolved in sterile water.

#### 2.4. Test system

Bacterial strains of *Salmonella typhimurium* TA97a, TA98, TA100, TA102 and TA1535, obtained from Prof. Bruce N. Ames, Berkeley, California, were used.

The bacteria were stored in small portions in a solution of 6 % DMSO in phosphate buffered saline in liquid nitrogen.

The actual batch of the strains was tested for ampicillin resistance (TA102: ampicillin/tetracycline resistance), UV-sensitivity and sensitivity against crystal violet, for spontaneous mutation frequencies and for sensitivities against the positive control substances in November 1997. The bacteria were stored frozen since that time.

The main genetic properties of these strains are:

| Strain: | his-Mutation: | rfa: | uvrB: | pkM101: |
|---------|---------------|------|-------|---------|
| TA97a   | D6610         | yes  | yes   | yes     |
| TA98    | D3052         | yes  | yes   | yes     |
| TA100   | G46           | yes  | yes   | yes     |
| TA102   | G428          | yes  | no    | yes     |
| TA1535  | G46           | yes  | yes   | no      |

D6610 and D3052 are frameshift mutations, G46 is a base pair mutation, G428 is an ochre-mutation.

The rfa mutation leads to a reduced lipopolysaccharide barrier in the cell wall and allows larger molecules to pass the cell wall. Bacteria with this mutation are sensitive to crystal violet.

UvrB results in a loss of the DNA-excision repair system. This increases the sensitivity to mutagenic influences. Bacteria with this mutation are sensitive to UV light.

The plasmide pkM101 also disturbs the ability of the bacteria to repair genetic damage and therefore increases their sensitivity to mutagens. Bacteria with this plasmide are resistant against ampicillin. TA102 is also resistant against tetracycline.

#### **2.4.1. Justification for the bacterial strains used**

*S. typhimurium* TA97a (or TA97 or TA1537), TA98, TA100, TA102 (or *E. coli* WP2) and TA1535 are required by the OECD guideline.

#### **2.4.2. Conditions of cultivation**

One day before the Ames test was performed, a small amount from each of the frozen bacterial cultures was transferred to nutrient broth. The liquid cultures were incubated overnight at 37 °C and then used for the exposure.

#### **2.5. Metabolic system**

The microsomal fraction of homogenised livers of rats treated once with 500 mg/kg of Aroclor 1254 was used. The preparation was from May 1998. Four days after treatment, the feed was withdrawn for one night. The livers of the animals were removed and homogenised in cold 0.15 mol/l KCl. Three ml of homogenate were obtained per gram of liver. Then the homogenate was centrifuged for 10 minutes at 9000 x g. The supernatant contained the microsomes. Small portions of the microsomes were stored in liquid nitrogen. Immediately before use they were thawed and mixed with the cofactor solution. The metabolic activity of the microsomes was verified by the positive control substances of each study and by the positive control substances listed in Table 7.

#### **2.6. Exposure**

##### **2.6.1. Groups, concentrations, number of samples**

The test substance was tested without as well as with an external metabolising system (S9-mix). The results were verified by a second, independent experiment.

| samples            | concentrations used               | replicates |
|--------------------|-----------------------------------|------------|
| test substance     | 100, 33, 11, 3.7 and 1.2 µl/plate | 3 samples  |
| control (water)    | 100 µl                            | 6 samples  |
| positive control * | *(see below)                      | 3 samples  |

| Strain: | without S9         | with S9    |
|---------|--------------------|------------|
| TA97a   | 4NOPD, 10 µg       | DMBA, 5 µg |
| TA98    | 2NF, 2 µg          | 2AA, 1 µg  |
| TA100   | Sodium-azide, 2 µg | 2AA, 2 µg  |
| TA102   | tBHPO, 50 µg       | DHA, 50 µg |
| TA1535  | Sodium-azide, 1 µg | 2AA, 2 µg  |

4NOPD: 4-Nitro-o-phenylene-diamine

tBHPO: t-Butyl-hydroperoxide

2AA: 2- Aminoanthracene

DHA: 1,8-Dihydroxy-anthraquinone

DMBA: 7,12-Dimethylbenz[a]anthracene

2NF: 2-Nitrofluorene

### 2.6.2. Justification for the concentrations

The guidelines recommend 5 mg of 'pure' substances per plate for the highest concentration. As the test substance was not a 'pure' chemical but rather an aqueous formulation, the highest technical feasible amount, 100 µl, was taken for the high concentration group. The other concentrations were obtained by subsequent dilution to one third each.

### 2.6.3. Exposure technique

The exposure was performed according to the 'Plate Incorporation Assay', in which bacteria, test substance (and microsomes) are in contact on the plate without preceding incubation in the liquid state. The number of viable cells in the overnight-culture is in the range of  $2 \times 10^8$  cells per ml.

For each sample the following solutions were combined:

- 0.1 ml of the overnight culture of the bacteria,

- 0.5 ml of S9-mix (or phosphate buffered saline for samples without metabolic activation),
- 0.1 ml of the appropriate test- or reference substance solution and
- 2 ml of top agar.

The combined solutions were mixed and spread over a plate with minimal agar (9 cm diameter). After the top agar had solidified, the plates were incubated at 37 °C until the colonies were visible (2 days).

### **2.7. Counting of colonies**

The plates were counted visually by marking the colonies with a felt tipped pen. From plates with more than about 300 colonies a fraction of the total area was counted visually and the total amount of colonies was calculated. When more than one person was counting, each person counted equal numbers of plates of the control group and of each of the dosed groups.

### **2.8. Statistical methods**

Means and standard deviation were calculated for the number of mutants in every concentration group.

For comparison of the control group and the test substance groups the analysis of variance was used followed by the test of Scheffé. For comparison of the control group and the positive control group, if the results were not clear beyond any doubt, the t-test was used.  $p = 0.05$  was used as the significance level.

The criteria for a positive result are:

A reproducible statistically significant increase of the number of revertants to more than twice the amount of the spontaneous revertants for at least one of the concentrations.

### **2.9. Unforeseen events**

No unforeseen events occurred which could impede the outcome of this study.

### **3. RESULTS**

#### **3.1. Properties of the bacteria**

The properties of the strains are listed in Table 7. The used strains of *Salmonella typhimurium* showed the expected genetic properties and were sensitive against several mutagenic chemicals.

#### **3.2. Reference substances**

The positive control substances increased the mutation frequency statistically significantly (Table 1 to Table 5). As 2-aminoanthracene, 1,8-dihydroxy-anthraquinone and 7,12-Dimethylbenz[a]anthracene require metabolic activation for mutagenicity, the results of these substances demonstrate also the efficiency of the metabolising system.

The mutation frequencies of the negative control groups were in the usual range for the different strains.

#### **3.3. Test substance**

The means and standard deviations of the results are shown in Table 1 to Table 5, the counts of the individual plates in Table 6.

##### **3.3.1. Solubility**

The test substance was freely miscible with water.

##### **3.3.2. Toxicity**

The test substance was not toxic to the *Salmonella* strains used. No reduced or missing bacterial background lawn was observed.

### 3.3.3. Mutagenicity

This is the parameter of major interest, because a substance is called mutagenic in the Ames test when a reproducible statistically significant increase in the number of revertants to more than twice the amount of the spontaneous revertants for at least one of the concentrations occurs.

There was no statistically significant increase in the number of mutants to more than twice the amount of the negative controls in any of the tested bacterial strains at any of the tested concentrations. The addition of an external metabolising system did not change these results.

According to these results, **"UKRAIN 5 mg Ampullen"** is not mutagenic in the Ames test with the strains of *Salmonella typhimurium* TA97a, TA98, TA100, TA102 and TA1535 up to 100 µl per plate.

## "UKRAIN 5 mg Ampullen": Salmonella Typhimurium Reverse Mutation Test

### Appendix 1: Composition of media and solutions

Overnight-medium: 0.8 g nutrient broth (Difco, Detroit, USA, article No. 0003-01-6),  
0.5 g NaCl p.a. in 100 ml H<sub>2</sub>O, autoclaved.

Top-agar: 3 g agar-agar (Oxoid, Basingstoke, UK, agar no. 1, code L11), 2.5 g NaCl p.a. in  
500 ml H<sub>2</sub>O, autoclaved.

Minimal agar: 7.6 g KH<sub>2</sub>PO<sub>4</sub> p.a., 27.2 g K<sub>2</sub>HPO<sub>4</sub> p.a., 3.9 g (NH<sub>4</sub>)<sub>2</sub>SO<sub>4</sub> p.a. and  
1 g Na<sub>3</sub>-citrate p.a. in 800 ml H<sub>2</sub>O. 0.4 g MgSO<sub>4</sub>·7H<sub>2</sub>O p.a. in 480 ml H<sub>2</sub>O.  
60 g agar-agar (Oxoid Agar no. 1, code L11) in 2.4 l H<sub>2</sub>O.  
20.5 g glucose (Merck, Darmstadt, D, article No. 8346) in 320 ml H<sub>2</sub>O.  
Autoclaved separately and combined thereafter. Immediately before use 40 ml of  
histidine-biotin solution are added per litre of agar.

Histidine-biotin solution: 13 mg histidine-hydrochloride- monohydrate (Merck, article No.  
4350) and 15 mg biotin (Merck, article No. 24514) per 100 ml of H<sub>2</sub>O, sterile filtered.

S9-mix: Each ml of microsomal fraction is combined with the following cofactor solution.

Cofactor solution: 13.2 ml of 0.2 mol/l Na<sub>2</sub>HPO<sub>4</sub>, 2.6 ml of H<sub>2</sub>O, 0.3 ml of 1.65 mol/l KCl,  
0.3 ml of 0.4 mol/l MgCl<sub>2</sub>, 31 mg of d-glucose-6-phosphate.Na<sub>2</sub> (Sigma, article G-7250)  
and 56 mg of NADP (Sigma, article N-0505).

Phosphate buffered saline (PBS): 8 g NaCl, 0.2 g KCl, 1.44 g Na<sub>2</sub>HPO<sub>4</sub>·2 H<sub>2</sub>O, 0.2 g KH<sub>2</sub>PO<sub>4</sub>  
in 1000 ml H<sub>2</sub>O.
